

CELLS

Lists and aliasing

Two names can refer to the **same** list. Changing it through one name is visible through the other.

```
In [1] def add_item(items, item):  
        """Append in place."""  
        items.append(item) # mutates  
  
        shopping = ["milk"]  
        also = shopping  
        add_item(also, "eggs")  
        print(shopping)
```

```
['milk', 'eggs']
```

```
In [2] len(shopping) * 2.5
```

When things go wrong

A name that was never assigned raises `NameError`.

```
In [3] print(missing)
```

```
